High Performance

Streamlined Application Development

The Nexsion Library contains a collection of utility routines that have been carefully coded, optimized and thoroughly tested to perform specific functions. Each utility routine was developed in native code for the HP NonStop Guardian Operating System. Matching utility routines are being migrated to the Linux/Unix and Windows operating Systems. This cross-platform compatibility will provide seamless flexibility in creating enterprise-wide applications.

The inherent versatility of our toolkit provides a faster, easier and more reliable application development cycle. This translates to increased functionality and flexibility, fewer problems and a lower cost of ownership to our customers.
